

Are You At Risk of Scalpel Injury?

A recent needlestick injury survey by the British Association of Dental Nurses (BADN), showed that [48% of respondents had received a sharps injury at work, and 58%](#) of whom had experienced more than one incident.

Sharps injuries have a number of serious consequences for individuals. In the best-case scenario, a sharps cut would just require time off work to have the mandatory blood tests. In the worst scenario however, you are risking a blood-borne infection or surgery to repair a damaged nerve or artery, and/or costly rehabilitation for you and your practice.

Qlicksmart single-handed scalpel blade removers

Qlicksmart multi-use scalpel blade removers have removed over 140 million blades. They are easy to use and reduces the risks of scalpel cuts drastically. These single-handed blade removers can be seamlessly integrated into a dental clinic's safety program by:

- Use of a scalpel blade removal system mounted in several stationary points within the dental surgery increasing its accessibility – scalpel blade removal can be completed at point of use
- Automatic containment of used scalpel blades ensures that all personnel are protected from injury.

Qlicksmart's [BladeFlask EVO](#) is a safety-engineered device which can help your dental practice prevent sharps injuries and comply with OSHA bloodborne pathogen standard requirements. The Bard-Parker 3LA bent handle used specifically with dental procedures can ONLY be used the BladeFlask EVO. This makes the BladeFlask EVO Scalpel Blade Remover the perfect addition to your dental surgical practice.
